

Contents

1. Introduction	5
2. The nearby cycle functor and its properties	11
3. The multiplicative convolution of elementary mer. connections	13
3.1. Nearby cycle functor and convolution of elementary formal meromorphic connections	14
3.2. A special case	16
3.3. Extension to arbitrary meromorphic functions $\psi \in \mathbf{y}^{-1}\mathbb{C}[\mathbf{y}^{-1}]$	21
3.3.1. The singular locus	21
3.3.2. The convolution formula	27
4. The additive convolution of elementary mer. connections	49
4.1. The case $m < n$	55
4.2. The case $n = m$	64
Appendix	81
A. An alternative formula for the additive convolution	83
A.1. A decomposition formula for the local formal Fourier transform	84
A.2. Expressing the additive convolution through Fourier transforms	86
A.3. Decomposition of the additive convolution in local summands	86
A.4. The special case of elementary formal meromorphic connections	89
Bibliography	93
