1 Introduction	1
-----------------------	----------

1.1 Motivation and background	1
1.2 Scope of this thesis	2
1.3 Thesis contribution and outline	2
1.4 List of Publications	3

2 Challenges of large-scale wind turbines integration into power systems	5
---	----------

2.1 Power system modeling for frequency analysis	5
2.1.1 Conventional power plant model	7
2.1.2 Wind power plant model	7
2.2 Operation principle of variable speed wind turbines	8
2.2.1 Doubly Fed Induction Generator wind turbine	10
2.2.2 Dynamic model of DFIG wind turbines	11
2.3 Operation mode of the integrated DFIG wind turbines	13
2.3.1 Maximum power point operation mode	13
2.3.2 Influence of wind fluctuation on frequency stability in power systems	14
2.4 Interconnection techniques of wind turbines to the grid	16
2.4.1 Grid-connected wind turbines in grid-following mode	16
2.4.2 Grid-connected wind turbines in grid-supporting mode	17
2.4.3 Grid-connected wind turbines in grid-forming mode	18
2.5 Available power and active power control of wind turbines	19
2.5.1 Wind turbine plant-model mismatch	19
2.6 Stability of power systems with high wind penetration	22
2.7 Summary on the new challenges of integrating wind turbines into the power system	24

3 Future inertia and frequency support from wind turbines	27
--	-----------

3.1 Inertia constant and power system stability	27
3.2 TSO requirements for future integration of generating units	28

3.2.1	Frequency defense plan	29
3.2.2	RoCoF withstand capability	29
3.2.3	Fast frequency response (FFR)	32
3.2.4	Frequency containment reserve (FCR)	34
3.3	Wind turbines contribution to grid frequency support	36
3.3.1	Short-term frequency support (synthetic inertial response) . .	37
3.3.2	Long-term frequency support (de-loading operation)	40
3.4	Adaptive MPC strategy for long-term frequency support from wind turbines	42
3.4.1	Model predictive approach for available power estimation . . .	43
3.4.2	Local adaptive MPC strategy for APC at wind turbine level .	49
3.4.3	Adaptive MPC strategy at TSO level	52
3.4.4	Optimal control problem	53
3.4.5	Solving the optimization problem	53
3.4.6	Constraints and limitations	54
4	Data-enabled predictive control for active power set-points distri- bution	57
4.1	Active power set-point distribution at TSO level	57
4.1.1	conventional droop control strategy	58
4.1.2	Model predictive control strategy	62
4.1.3	Limitation of model-based control strategies	65
4.2	Behavioral system theory	66
4.2.1	Dynamical systems as sets of trajectories	67
4.2.2	Controllability in the behavioral setting	68
4.2.3	Data-enabled predictive control algorithm	68
4.3	Regularization and robustness of DeePC	72
4.3.1	Corruption of input/output measurements	72
4.3.2	Corruption of Hankel Matrix	73
4.3.3	Robust DeePC problem formulation	73
4.4	Model-free DeePC for active power and frequency control in power systems	74
4.4.1	Solving optimization problem with DeePC	76
4.4.2	Robustified DeePC problem formulation for optimal active power and grid frequency control	77
4.4.3	Case study: Frequency control and active power set-point dis- tribution in power system	79
5	Stability and synchronization in heterogenous power system	83
5.1	Stability analysis in power systems	83

5.1.1	Steady-state stability	83
5.1.2	Dynamic stability	84
5.1.3	Transient stability	84
5.1.4	Stability analysis based on Lyapunov theory	84
5.2	Kuramoto theory	85
5.2.1	1st-order Kuramoto model	86
5.2.2	2nd-order Kuramoto model	87
5.3	Stability analysis based on Kuramoto model	88
5.3.1	Swing equation	89
5.3.2	Stability analysis of 1st-order Kuramoto model	90
5.3.3	Stability analysis of 2nd-order nonuniform Kuramoto model	92
5.3.4	Physical interpretation of convergence condition	95
5.4	Stable operation of interconnected generating units	96
5.4.1	Synchronization between conventional generators	97
5.4.2	Synchronization between SGs and other grid-following units	99
5.5	Grid forming in WT and synchronization with grid	100
5.5.1	Proposed Grid-forming control structure for WT	100
5.5.2	Synchronization between WTs in grid-forming mode	101
5.6	Influence of frequency control strategy on grid stability	104
5.6.1	Case 1: Generating units response to a load change with droop control	106
5.6.2	Case 2: Comparison of droop and DeePC control strategy	107
6	Conclusions	111
6.1	Summary	111
6.1.1	Main Contributions	111
6.1.2	Limitations	112
6.2	Future Work	112
6.2.1	Optimal RES integration for grid frequency support	112
6.2.2	Application and Extensions of DeePC in power system	113
	Bibliography	115
	Bibliography	115
