Abstract	III
Kurzfassung	V
Publications	VII
Acronyms	XVIII
Symbols	XXI
1 Introduction to the investigation of isothermal processes in the production of large-scaled composite structures	1
1.1 Introduction to the topic and objective of the thesis	1
1.2 Structure of the thesis	3
2 Thermochemical and mechanical modelling of the composite production process	11
2.1 Interaction of the calculation models	11
2.2 Heat transfer in the process environment	12
2.3 Modelling of the chemical curing reaction	16
2.4 Mechanical analysis	18
2.4.1 Material models	18
2.4.2 Equilibrium conditions	21
2.5 Homogenisation of material properties	23
2.5.1 Self-consistent field micromechanics model	23
2.5.2 Numerical homogenisation	25
2.6 Transient dynamic analysis of low velocity impacts	27
2.7 Failure initiation model	27
2.8 Material input data for the investigation of influences of accelerated cooling conditions	31
3 Simulation environments for the thermochemical and mechanical calculation of the composite production process	37
3.1 Requirements for the simulation environments	37

3.2	Implementation of models in a state-of-the-art simulation environment	39
3.3	Transfer of models to a multiphysics simulation environment	40
3.4	Evaluation and comparison of simulation environments	42
3.5	Mathematical considerations and implementation of equations	49
3.5.1	Equation types	49
3.5.2	Numerical solvers	53
4	Behaviour of composite parts during demoulding by an impact at elevated temperatures	55
4.1	Demoulding in the composite production	55
4.2	Demoulding forces in different cooling scenarios	57
4.3	Setup for experimental and numerical evaluation of demoulding	62
4.4	Finite element models for the analysis of demoulding by an impact	65
4.5	Modelling the demoulding using an adhesive behaviour interaction formulation	68
4.6	Determination of the transient dynamic response of the structure at demoulding	69
4.7	Failure initiation due to the demoulding impact	74
4.7.1	Validation of the calculation of inter-fibre failure initiation	75
4.7.2	Evaluation of the criticality of damage due to impact demoulding	79
5	Influence of accelerated process conditions on stresses and failure initiation	83
5.1	Accelerated cooling conditions	83
5.2	Theoretical consideration of influence of cooling rates on stresses and strains	84
5.3	Experimental and numerical validation of predicted temperature and deflection	87
5.4	Validation of mechanical properties	93
5.5	Robustness of numerical models and validity of the conclusions	95

6	Summary and Outlook	101
6.1	Summary	101
6.2	Outlook	103
7	Appendix	105
7.1	Material data and boundary conditions of the reference model	105
7.2	Abaqus user subroutine for 3D part of the of the reference model	108
7.3	Abaqus user subroutine for 2D part of the of the reference model	110
7.4	Abaqus user subroutine VUSDFLD for Puck failure initiation .	123
